Key Insights & Recommendations

Paediatric Epilepsy Clinical Trial Intelligence | Data Source: ClinicalTrials.gov | 807 Studies Analysed

KEY FINDINGS

1. Research has grown 5x since 2000
Paediatric epilepsy trials increased from ~5/year (2000) to 56 trials in 2024 - reflecting growing global priority.
2. USA dominates with 44% of all trials
355 of 807 trials are US-based, creating a heavily skewed global research landscape.
3. India contributes only 2.48% globally
Despite being home to ~10-12 million people with epilepsy, India runs only 20 paediatric trials - a critical research equity gap.
4. Phase 3 dominates (238 trials)
Late-stage research is mature but early innovation pipeline is weak -only 6 Early Phase 1 trials globally.
5. 56.5% of trials are completed
A large evidence base exists but translation to low-middle income countries remains poor.

STRATEGIC RECOMMENDATIONS

For Policymakers & Health Ministries:

- Increase domestic research funding for paediatric neurology in India and low-middle income countries
- Create fast-track regulatory pathways for paediatric epilepsy drug approvals

For Pharmaceutical Companies:

- Significant market opportunity exists in Asia-Pacific — only 3.5% of trials are India-based despite large patient pool
- Phase 1/2 pipeline is underfunded — early-stage investment needed for next generation AEDs

For Healthcare Consultancies:

- Real-world evidence gap in LMIC settings represents an unmet need for HEOR studies
- India-specific pharmacoeconomic models needed to support market access decisions
